A Bit of Web History

"Consider a future device for individual use, which is a sort of mechanized private file and library. It needs a name, and to coin one at random, "memex" will do. A memex is a device in which an individual stores all his books, records, and communications, and which is mechanized so that it may be consulted with exceeding speed and flexibility. It is an enlarged intimate supplement to his memory."

1945:

- Vannevar Bush, "As we may think", Atlantic Monthly, July, 1945.
 - Describes the idea of a distributed hypertext system.
 - A "memex" that mimics the "web of trails" in our minds.

A Bit of Web History

- 1989
 - Tim Berners-Lee (CERN) writes internal proposal to develop a distributed hypertext system.
 - Connects "a web of notes with links."
 - Intended to help CERN physicists in large projects share and manage information
- 1990
 - Tim Berners-Lee writes a graphical browser for Next machines.
- 1992
 - NCSA server released
 - 26 WWW servers worldwide

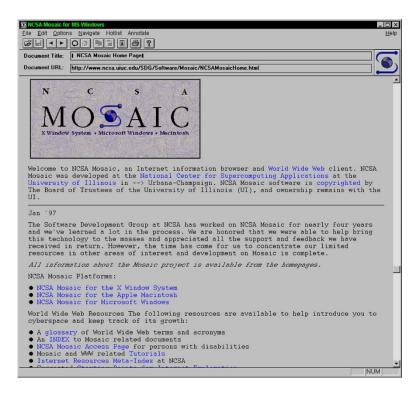

A Bit of Web History

1993

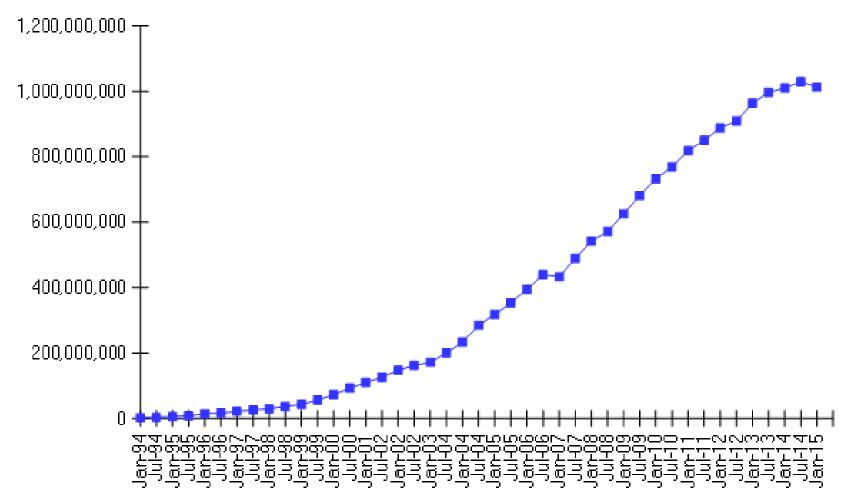

- Marc Andreessen releases first version of NCSA Mosaic browser
- Mosaic version released for (Windows, Mac, Unix).
- Web (port 80) traffic at 1% of NSFNET backbone traffic.
- Over 200 WWW servers worldwide.

1994

 Andreessen and colleagues leave NCSA to form "Mosaic Communications Corp" (predecessor to Netscape).

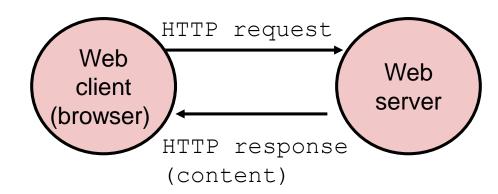

Internet Hosts

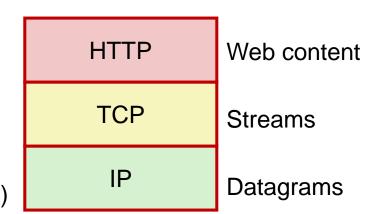

Source: Internet Systems Consortium (www.isc.org)

Web Servers

- Clients and servers communicate using the HyperText Transfer Protocol (HTTP)
 - Client and server establish TCP connection
 - Client requests content
 - Server responds with requested content
 - Client and server close connection (eventually)
- HTTP/1.1
 - original <u>RFC 2616</u>, <u>June 1999</u>
 - redefined by RFCs 7230-7235 (June 2014)
- Brand new: HTTP/2
 - RFC 7540, May 2015

Web Content

- Web servers return content to clients
 - content: a sequence of bytes with an associated MIME (Multipurpose Internet Mail Extensions) type
- Example MIME types

text/htmlHTML document

text/plainUnformatted text

application/postscriptPostcript document

image/gif Binary image encoded in GIF format

image/jpeg Binary image encoded in JPEG format

Static and Dynamic Content

- The content returned in HTTP responses can be either static or dynamic.
 - Static content: content stored in files and retrieved in response to an HTTP request
 - Examples: HTML files, images, audio clips.
 - Request identifies content file
 - Dynamic content: content produced on-the-fly in response to an HTTP request
 - Example: content produced by a program executed by the server on behalf of the client.
 - Request identifies file containing executable code
- Bottom line: All Web content is associated with a file that is managed by the server.

URLs

- Each file managed by a server has a unique name called a URL (Universal Resource Locator)
- URLs for static content:
 - http://www.cs.cmu.edu:80/index.html
 - http://www.cs.cmu.edu/index.html
 - http://www.cs.cmu.edu
 - Identifies a file called index.html, managed by a Web server at www.cs.cmu.edu that is listening on port 80.
- URLs for dynamic content:
 - http://www.cs.cmu.edu:8000/cgi-bin/proc?15000&213
 - Identifies an executable file called proc, managed by a Web server at www.cs.cmu.edu that is listening on port 8000, that should be called with two argument strings: 15000 and 213.

How Clients and Servers Use URLs

- Example URL: http://www.cmu.edu:80/index.html
- Clients use prefix (http://www.cmu.edu:80) to infer:
 - What kind of server to contact (Web server)
 - Where the server is (www.cmu.edu)
 - What port it is listening on (80)
- Servers use suffix (/index.html) to:
 - Determine if request is for static or dynamic content.
 - No hard and fast rules for this.
 - Convention: executables reside in cgi-bin directory
 - Find file on file system.
 - Initial "/" in suffix denotes home directory for requested content.
 - Minimal suffix is "/", which all servers expand to some default home page (e.g., index.html).

Anatomy of an HTTP Transaction

unix> telnet www.cmu.edu 80
Trying 128.2.10.162...
Connected to www.cmu.edu.
Escape character is '^]'.
GET / HTTP/1.1
host: www.cmu.edu

HTTP/1.1 301 Moved Permanently
Location: http://www.cmu.edu/index.shtml

Connection closed by foreign host.

Client: open connection to server Telnet prints 3 lines to the terminal

Client: request line

Client: required HTTP/1.1 HOST header Client: empty line terminates headers.

Server: response line Client should try again

Server: closes connection

Client: closes connection and terminates

Anatomy of an HTTP Transaction, Take 2

```
unix> telnet www.cmu.edu 80
Trying 128.2.10.162...
Connected to www.cmu.edu.
Escape character is '^]'.
GET /index.shtml HTTP/1.1
host: www.cmu.edu
```

HTTP/1.1 200 OK

Date: Fri, 29 Oct 2010 19:41:08 GMT

Server: Apache/1.3.39 (Unix) mod pubcookie/3.3.3 ...

Transfer-Encoding: chunked
Content-Type: text/html

Connection closed by foreign host.

unix>

Client: open connection to server Telnet prints 3 lines to the terminal

Client: request line

Client: required HTTP/1.1 HOST header Client: empty line terminates headers.

Server: responds with web page

Lots of stuff

Server: closes connection

Client: closes connection and terminates

HTTP Requests

- HTTP request is a request line, followed by zero or more request headers
- Request line: <method> <uri> <version>
 - <version> is HTTP version of request (HTTP/1.0 or HTTP/1.1)
 - <uri>is typically URL for proxies, URL suffix for servers.
 - A URL is a type of URI (Uniform Resource Identifier)
 - See http://www.ietf.org/rfc/rfc2396.txt
 - <method> is either GET, POST, OPTIONS, HEAD, PUT, DELETE, or TRACE

HTTP Requests (cont)

- HTTP methods:
 - GET: Retrieve static or dynamic content
 - Arguments for dynamic content are in URI
 - Workhorse method (99% of requests)
 - POST: Retrieve dynamic content
 - Arguments for dynamic content are in the request body
 - OPTIONS: Get server or file attributes
 - HEAD: Like GET but no data in response body
 - PUT: Write a file to the server!
 - DELETE: Delete a file on the server!
 - TRACE: Echo request in response body
 - Useful for debugging.
- Request headers: <header name>: <header data>
 - Provide additional information to the server.

HTTP Responses

- HTTP response is a response line followed by zero or more response headers.
- Response line:
- <version> <status code> <status msg>
 - <version> is HTTP version of the response.
 - <status code> is numeric status.
 - <status msg> is corresponding English text.

) 200	OK	Request was handled without error
301	Moved	Provide alternate URL

403 Forbidden Server lacks permission to access file

404 Not found Server couldn't find the file.

- Response headers: <header name>: <header data>
 - Provide additional information about response
 - Content-Type: MIME type of content in response body.
 - Content-Length: Length of content in response body.

GET Request

Accessing http://csap.snu.ac.kr/~bernhard/sysprog.html

```
GET /~bernhard/sysprog.html HTTP/1.1
Host: csap.snu.ac.kr
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:31.0)
Gecko/20100101 Firefox/31.0
Connection: keep-alive
Accept-Language: ko-kr,ko;q=0.5
Accept-Encoding: gzip, deflate
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,
*/*;q=0.8
CRLF (\r\n)
```

Note: URI is just the suffix, not the entire URL

GET Response From Server

Response from http://csap.snu.ac.kr/~bernhard/sysprog.html

```
HTTP/1.1 200 OK
Server: Apache
Last-Modified: Mon, 25 May 2015 05:35:43 GMT
Keep-Alive: timeout=15, max=100
Etaq: "83b212b-21f-516e161904983"
Date: Mon, 25 May 2015 05:39:37 GMT
Content-Type: text/html
Content-Length: 543
Connection: Keep-Alive
Accept-Ranges: bytes
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01</pre>
Transitional//EN"
   "http://www.w3.org/TR/html4/loose.dtd">
<html>
</html>
```

HTTP Versions

- HTTP/1.0
 - new connection for each transaction.
- HTTP/1.1
 - support for persistent connections
 - ▶ Connection: Keep-Alive
 - multiple transactions over the same connection
 - HOST header mandatory
 - Host: csap.snu.ac.kr
 - Makes it possible to host multiple websites at single Internet host
 - support for chunked encoding (described later)
 - Transfer-Encoding: chunked
 - HTTP/1.1 adds additional support for caching

HTTP Versions

- HTTP/2
 - multiplexing
 - multiple streams in a single HTTP connection
 - priorities for streams
 - depending on content or by request
 - priority tree for streams for different content
 - header compression
 - avoid sending the entire HTTP header for each request
 - this, in fact, makes HTTP/2 a stateful protocol
 - server push
 - server may send included files automatically (instead of waiting for a request)

How the current priority scheme got into HTTP/2

"...Still, consensus remained elusive at the meeting. To break the impasse and close on a decision, a coin toss was proposed and accepted. Tails. The stream dependencies proposal won the toss. ..."

https://msopentech.com/blog/2014/03/19/http2-nearing-completion/

Webservices

- WWW 101
 - History
 - HTTP Protocol
- Tiny Web Server
 - Basics
 - Static Content
 - Dynamic Content
- Proxies

Tiny Web Server

- Tiny Web server described in text
 - Tiny is a sequential Web server.
 - Serves static and dynamic content to real browsers.
 - text files, HTML files, GIF and JPEG images.
 - 226 lines of commented C code.
 - Not as complete or robust as a real web server

Tiny Operation

- Read request from client
- Split into method / uri / version
 - If not GET, then return error
- If URI contains "cgi-bin" then serve dynamic content
 - (Would do wrong thing if had file "abcgi-bingo.html")
 - Fork process to execute program
- Otherwise serve static content
 - Copy file to output

Tiny Serving Static Content

```
From tiny.c
Send response headers to client */
 get filetype (filename, filetype);
 sprintf(buf, "HTTP/1.0 200 OK\r\n");
 sprintf(buf, "%sServer: Tiny Web Server\r\n", buf);
 sprintf(buf, "%sContent-length: %d\r\n", buf, filesize);
 sprintf(buf, "%sContent-type: %s\r\n\r\n",
         buf, filetype);
 Rio writen(fd, buf, strlen(buf));
 /* Send response body to client */
 srcfd = Open(filename, O RDONLY, 0);
 srcp = Mmap(0, filesize, PROT READ, MAP PRIVATE, srcfd, 0);
 Close (srcfd);
 Rio writen (fd, srcp, filesize);
 Munmap(srcp, filesize);
```

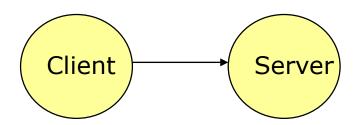

- Serve file specified by filename
- Use file metadata to compose header
- "Read" file via mmap
- Write to output

Serving Dynamic Content

- Client sends request to server.
- If request URI contains the string "/cgi-bin", then the server assumes that the request is for dynamic content.

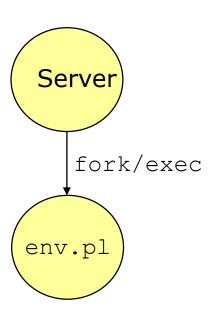

GET /cgi-bin/env.pl HTTP/1.1

Serving Dynamic Content (cont)

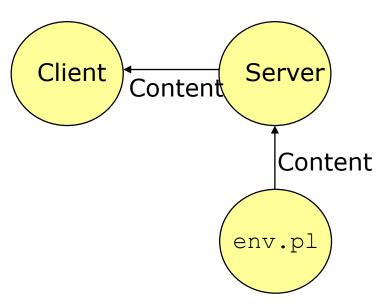

The server creates a child process and runs the program identified by the URI in that process

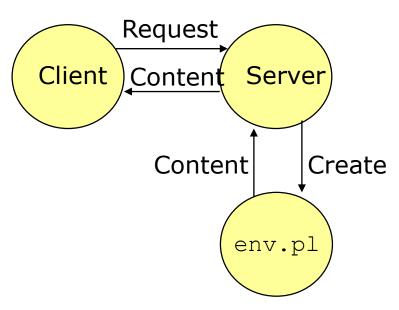

Serving Dynamic Content (cont)

- The child runs and generates the dynamic content.
- The server captures the content of the child and forwards it without modification to the client

Issues in Serving Dynamic Content

- How does the client pass program arguments to the server?
- How does the server pass these arguments to the child?
- How does the server pass other info relevant to the request to the child?
- How does the server capture the content produced by the child?
- These issues are addressed by the Common Gateway Interface (CGI) specification.

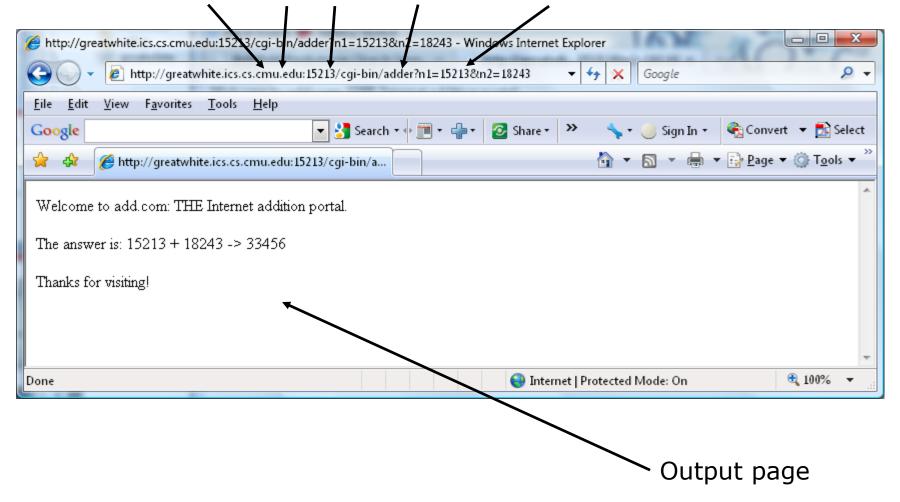

CGI

- Because the children are written according to the CGI spec, they are often called CGI programs.
- Because many CGI programs are written in Perl, they are often called CGI scripts.
- However, CGI really defines a simple standard for transferring information between the client (browser), the server, and the child process.

The add.com Experience

input URLhost port CGI program args

- Question: How does the client pass arguments to the server?
- Answer: The arguments are appended to the URI
- Can be encoded directly in a URL typed to a browser or a URL in an HTML link
 - http://add.com/cgi-bin/adder?n1=15213&n2=18243
 - adder is the CGI program on the server that will do the addition.
 - argument list starts with "?"
 - arguments separated by "&"
 - spaces represented by "+" or "%20"
- URI often generated by an HTML form

```
<FORM METHOD=GET ACTION="cgi-bin/adder">
X <INPUT NAME="n1">
Y <INPUT NAME="n2">
<INPUT TYPE=submit>
</FORM>
```

- URL:
 - cgi-bin/adder?n1=15213&n2=18243
- Result displayed on browser:

Welcome to add.com: THE Internet addition portal. The

answer is: 15213 + 18243 -> 33456

Thanks for visiting!

- Question: How does the server pass these arguments to the child?
- Answer: In environment variable QUERY_STRING
 - A single string containing everything after the "?"
 - For add: QUERY_STRING = "n1=15213&n2=18243"

From adder.c

```
if ((buf = getenv("QUERY_STRING")) != NULL) {
   if (sscanf(buf, "n1=%d&n2=%d\n", &n1, &n2) == 2)
      sprintf(msg, "%d + %d -> %d\n", n1, n2, n1+n2);
   else
      sprintf(msg, "Can't parse buffer '%s'\n", buf);
}
```

Additional CGI Environment Variables

- General
 - SERVER_SOFTWARE
 - SERVER_NAME
 - GATEWAY_INTERFACE (CGI version)
- Request-specific
 - SERVER_PORT
 - REQUEST_METHOD (GET, POST, etc)
 - QUERY_STRING (contains GET args)
 - REMOTE_HOST (domain name of client)
 - REMOTE_ADDR (IP address of client)
 - CONTENT_TYPE (for POST, type of data in message body, e.g., text/html)
 - CONTENT_LENGTH (length in bytes)

Even More CGI Environment Variables

- In addition, the value of each header of type type received from the client is placed in environment variable HTTP_type
 - Examples (any "-" is changed to "_") :
 - HTTP_ACCEPT
 - HTTP_HOST
 - HTTP_USER_AGENT

- Question: How does the server capture the content produced by the child?
- Answer: The child generates its output on stdout. Server uses dup2 to redirect stdout to its connected socket.
 - Notice that only the child knows the type and size of the content. Thus the child (not the server) must generate the corresponding headers.

```
linux> telnet greatwhite.ics.cs.cmu.edu 15213
Trying 128.2.220.10...
Connected to greatwhite.ics.cs.cmu.edu (128.2.220.10).
_Escape character is '^]'.
GET /cgi-bin/adder?n1=5&n2=27 HTTP/1.1
\langle CRLF \rangle
HTTP/1.0 200 OK
                                  HTTP response generated by
Server: Tiny Web Server
                            ___ _ <u>the server</u> _ _ _ _ _
Content-Iength: 109
Content-type: text/html
Welcome to add.com: THE Internet addition portal.
\langle p \rangleThe answer is: 5 + 27 -> 32
                                    HTTP response generated by
                                    the CGI program
Thanks for visiting!
Connection closed by foreign host.
```

Tiny Serving Dynamic Content

```
/* Return first part of HTTP response */
   sprintf(buf, "HTTP/1.0 200 OK\r\n");
   Rio writen(fd, buf, strlen(buf));
   sprintf(buf, "Server: Tiny Web Server\r\n");
   Rio writen(fd, buf, strlen(buf));
   if (Fork() == 0) { /* child */
      /* Real server would set all CGI vars here */
      setenv("QUERY STRING", cgiargs, 1);
      Dup2(fd, STDOUT FILENO); /* Redirect stdout to client */
      Execve(filename, emptylist, environ); /* Run CGI prog
   Wait(NULL); /* Parent waits for and reaps child */
```

- Fork child to execute CGI program
- Change stdout to be connection to client
- Execute CGI program with execve

Data Transfer Mechanisms

- Standard
 - Specify total length with content-length
 - Requires that program buffer entire message
- Chunked
 - Break into blocks
 - Prefix each block with number of bytes (Hex coded)

Chunked Encoding Example

```
HTTP/1.1 200 OK\n
Date: Sun, 31 Oct 2010 20:47:48 GMT\n
Server: Apache/1.3.41 (Unix)\n
Keep-Alive: timeout=15, max=100\n
Connection: Keep-Alive\n
Transfer-Encoding: chunked\n
Content-Type: text/html\n
\r\
         First Chunk: 0xd75 = 3445 bytes
d75\r\n
<ntm1>
<head>
...k href="http://www.cs.cmu.edu/style/calendar.css" rel="stylesheet"
type="text/css">
</head>
<body id="calendar body">
<div id='calendar'>
cellspacing='1' id='cal'>
</body>
</html>
\r\n
         Second Chunk: 0 bytes (indicates last chunk)
0\r\n
```

\r\n

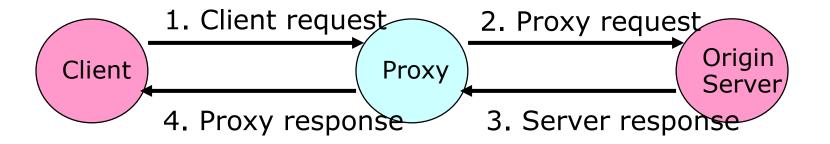

Webservices

- WWW 101
 - History
 - HTTP Protocol
- Tiny Web Server
 - Basics
 - Static Content
 - Dynamic Content
- Proxies

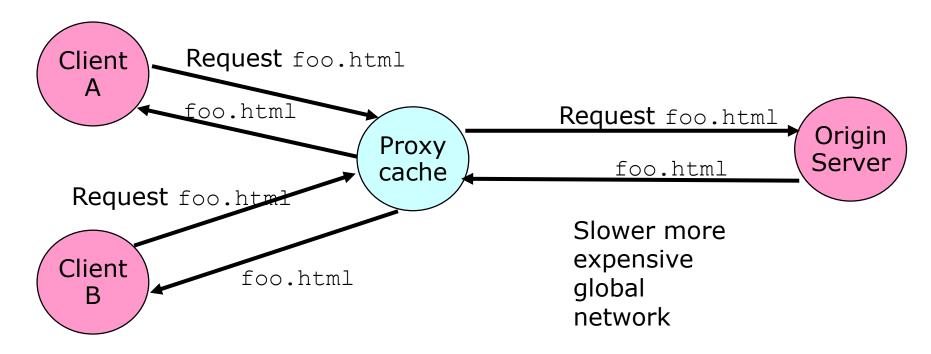

Proxies

- A proxy is an intermediary between a client and an origin server.
 - To the client, the proxy acts like a server.
 - To the server, the proxy acts like a client.

Why Proxies?

- Can perform useful functions as requests and responses pass by
 - Examples: Caching, logging, anonymization, filtering, transcoding

Fast inexpensive local network

For More Information

- Study the Tiny Web server described in your text
 - Tiny is a sequential Web server.
 - Serves static and dynamic content to real browsers.
 - text files, HTML files, GIF and JPEG images.
 - 220 lines of commented C code.
 - Also comes with an implementation of the CGI script for the add.com addition portal.
- See the HTTP/1.1 standard:
 - http://www.w3.org/Protocols/rfc2616/rfc2616.html
